                                                                                                                                                                                                              The sequence encodes a maganese superoxide dismutase which can be used t catalyse the reduction of superoxide (SO) radicals to hydrogen peroxide and molecular oxygen. It can be used to reduce reperfusion injury following ischaemia and prolong the survival of excised organs. It can also me used as a long acting anti-inflamatory drug. gt10 in Escherichia coli, by screening with a 5'-probe (AAT15591) and a 3'-probe (AAT15522). The sequence of the insert in plasmid pMS8-4 (Obtained by subcloning in plasmid pBR322) is shown. The cDNA may be expressed in e.g. E. coli for production of recombinant MASOD. The MMSOD product may be cleaved with Aeromonas proteolytica aminopeptidase to produce an N-terminally truncated analogue with lysine and optionally histidine residues removed. The MMSOD analogue may be used in therapy of conditions associated with generation of coxygen free radicals, particularly synovial inflammation, arthritis and lung fibrosis (claimed). (Updated on 25-MAR-2003 to correct PF field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A cDNA clone (AAT34277) codes for human manganese superoxide dismutase (MNSOD) (AAW00018), an enzyme that catalyees the reduction of superoxide radicals to H202 and 02. It was isolated from a human T- cell library cloned into vector grlu using probes (see also AAT34283- 84) based on Partions of mature MNSOD. The MNSOD gene was also dentified (see also AAT34278-82). The cDNA can be used for the produ. of recombinant MNSOD using e.g. Escherichia coli cells as hosts. The MNSOD is useful for reducing reperfusion injury, treating inflammation or bronchial pulmonary dysplasia and for prolonging survival (Excised organs. (Updated on 25-MAR-2003 to correct PR

cDNA encoding a human manganese superoxide dismutase.

(first entry)

04-DEC-2000

AAA63891;

```
This cDNA sequence codes for human manganese superoxide dismutase
(hMmSDD) see AAW98169). Novel MnSOD proteins having catalytic activity
which differs from this natural hMmSOD are claimed. The modified proteins
exhibit reduced or no product inhibition, or have greater activity, or
both, compared to natural hMmSOD. The modifications involve one or amin
caid substitutions within the active site of the enzyme, especially at
residues His-26, His-30, Tyr-34, His-74, Gln-143, Asp-159, Trp-161 and
His-163 (see also AAW9817-77). Nucleic acids encoding the modified hMmSOD proteins, or
expression vectors in which modified hMmSOD nucleic acid is linked to a
promoter (preferably mammalian), can be used to protect a cell line from
damage caused by superoxide radicals (claimed). They can also be used to
create subjects suffering from, or at risk of, cytotoxicity caused by
superoxide radicals (claimed), As such, they can be used as antioxidants
in the treatment of a variety of disorders, including inflammation
claimed), reperfusion injury following ischemia (claimed), and cellular
                                                                                                                                                                                                                                                                                                                                                                                                                                   2;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       128
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             167

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence encodes a human manganese superoxide dismutase protein (hMm SOD). The specification describes a modified hMm SOD which has a catalytic activity which differs from natural hMm SOD in that it exhibits reduced or no product inhibition compared to natural hMm SOD. The natural hMm SOD is especially modified with one or more substitutions in amino acids 26, 30, 34, 74, 143, 159, 161 and 163. The modified hMm SOD is useful for protecting a cell from damage caused by superoxide radicals and for treating a subject suffering from cytotoxicity caused by superoxide radicals. The protein is useful for treating inflammation and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel human manganese superoxide dismutase protein useful as antioxidant for treating cytotoxicity caused by superoxide radicals, inflammation and reperfusion injury following ischemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     128

This purified cDNA encodes both prepro- and mature-manganese superoxide dismutase (MSOD). It is one strand of a double stranded molecule contained in a recombinant vehicle. The MSOD produced catalyses the reaction of hydrogen ions and the SOD radical anion to form hydrogen peroxide and water. It is useful in veterinary and pharmaceutical compsns. for e.g. reducing lesions of reperfusion following ischaemia, to prolong survival time isolated organs and for treating inflammation. See also AAN71371-72. (Updated on 10-MAR-2003 to add missing OS field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is the nucleotide sequence of human manganese superoxide dismutase (hSODm) cDNA. The CDNA was isolated from an adult human kidney cDNA library in landa-gtl0 using the probes given in ABNB4889-90. The invention relates to methods for hSODm gene cloning and expression in microorganisms, especially Escherichia coli or Saccharomyces cerevisiae. The hSODm cDNA is inserted into a vector for expression in the microbial host, preferably under conditions which allow for processing to remove the N-terminal methionine. The expression product is useful for treating a patient having inflammantory joint disease (e.g. osteoarthritis or rheumatoid archritis), or to minimise post-ischaemic tissue damage resulting from disease or surgery
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    224
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               188

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

mRNA was extracted from graminating teliospores. CDNA was
amplified by PCR and unidirectionally cloned into pDNR-LIB
plasmid with the use of Clontech's Creator SMART CDNA
                                                                                                                                                                                                                                                                                         29-AUG-2003

Axenic plate culture") and a third library represents axenically grown plants ('FHIG:C') Axenic plate culture'). Libraries were analyzed in parallel and 3555 (FHIG:A), 3964 (FHIG:B), and 2532 (FHIG:C) high-quality (PHRED 20) ESTS of >99bp have been deposited. The CDNA libraries were constructed from total RNA using the SMART CDNA library Construction kit (#K1051-1, Clontech, Palo Alto, CA, USA) according to the manufacturer's instructions. Full-length CDNAs were trimmed by Sfii, fractionated and directionally ligated into (lambda)TriplEx2 arms. The lambda library was convexted to a plasmid library via site-specific recombination at loxP sites in a Cre+ strain (E. coli BM25.8). Plasmid clones were randomly collected and analysed by DNA sequencing using a plasmid-specific forward primer (P104)."
